

SMART FASHION RECOMMENDER APPLICATION

Problem Statement :

In E-commerce websites, users need to search for products and navigate across screens to view the product, add them to the cart, and order product. The smart fashion recommender application leverages the use of a chat bot to interact with the users, gather information about their preferences, and recommend suitable products to the users. The roles are customer and admin. The application demands redirection of the user to the appropriate dashboard based on the assigned role. Admin should be able to track the number of different products and admin should be assigned the responsibility to create products with appropriate categories. The user should be able to mention their preferences using interacting with chat bots. The user must receive a notification on order confirmation/failure. The chat bot must gather feedback from the user at the end of order confirmation. The main objective of this application is to provide better interactivity with the user and to reduce navigating pages to find appropriate products.

DEFINING THE PROBLEM

Who can use this application ?	Everyone can access this application who seeking for online shopping infashion category.
What is the issue ?	Chat bot can't find that customerized product relevent in smart fashion recommender application.
